

Name: Divesh Lulla

Class: D15_C
Experiment 5

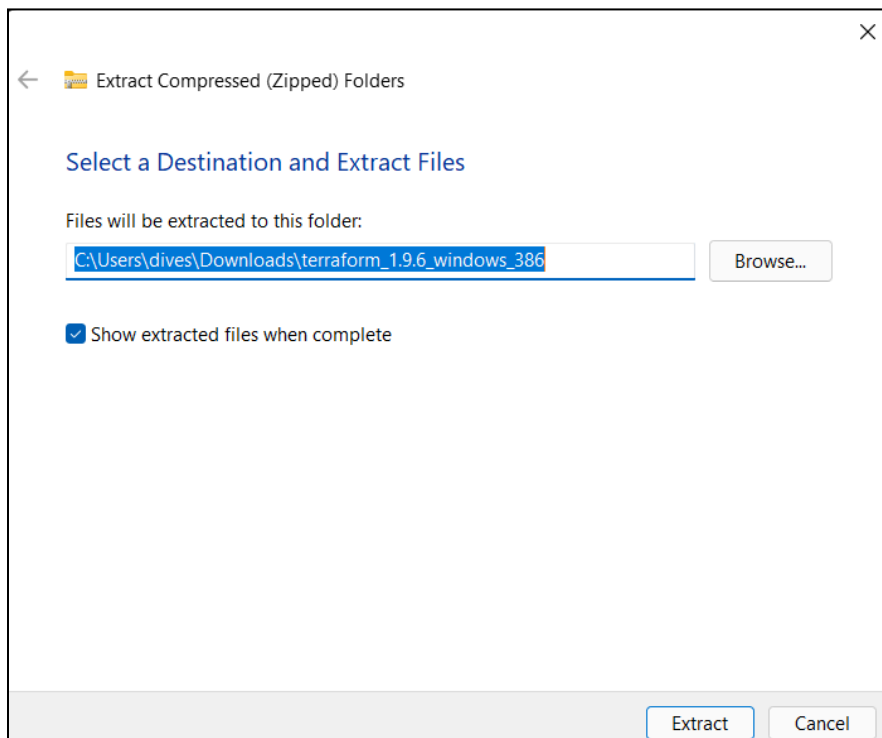

Roll no: 31

Aim: To understand the terraform lifecycle, core concepts/terminology and install it on Linux and windows.

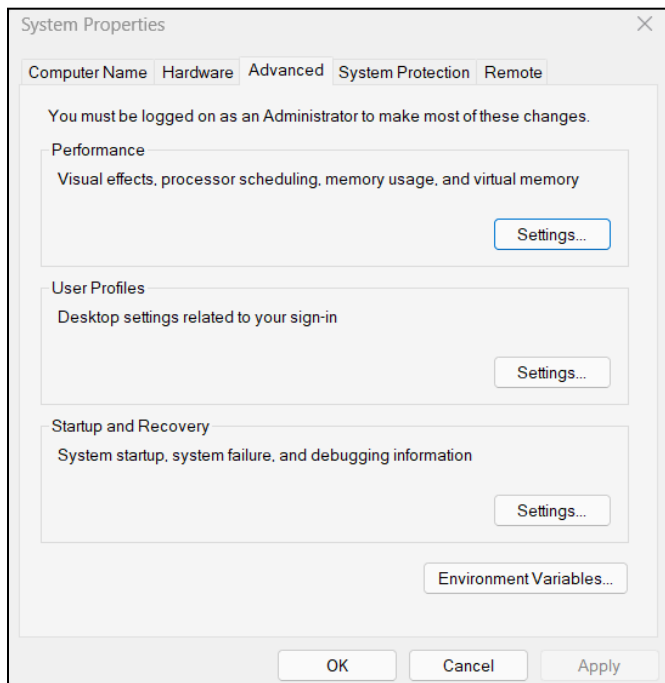

Step 1: Go to the browser and <https://developer.hashicorp.com/terraform/install> paste this link it will redirect you to downloading of the terraform.

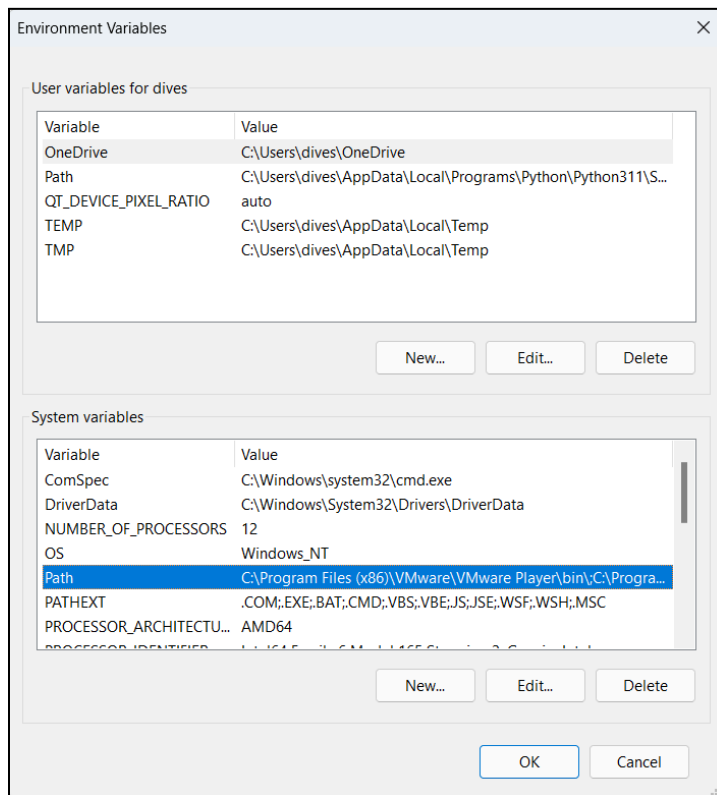

Step 2: After the zip file is downloaded make a folder named terraform in the C drive and then go to the location where the zip file was downloaded click on it and select the Extract files option.

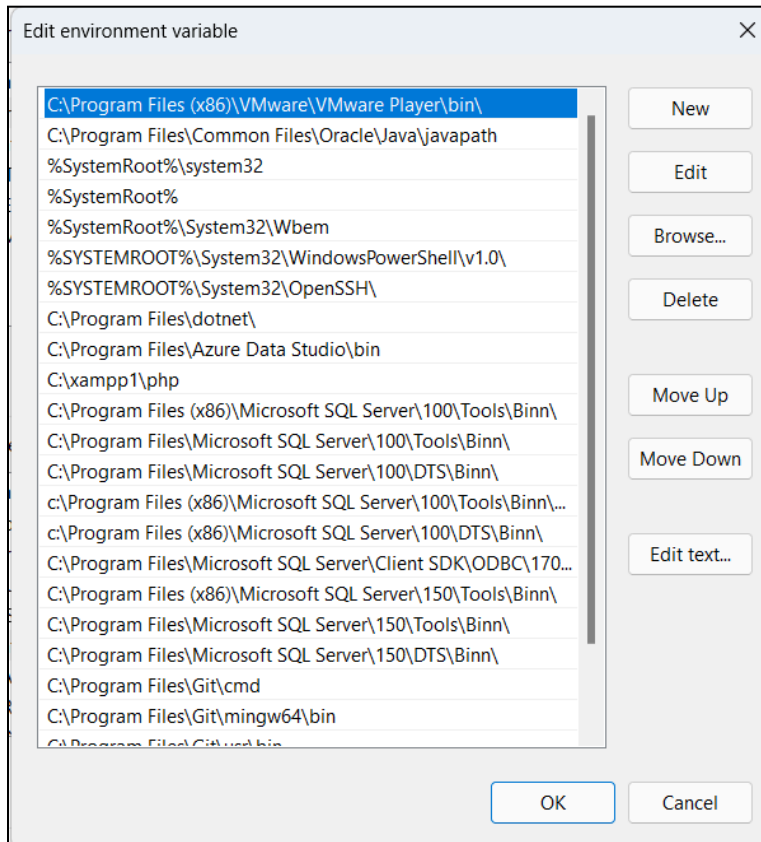

Step 3: Go to the system properties, click on environment variables.

Step 6: Here double click on the path. A new window will appear.

Step 7 : Click on new and paste the path in it then click on ok.

Step 8 : After this click on the search bar and open windows shell and search the following command.

```
Windows PowerShell

Install the latest PowerShell for new features and improvements! https://aka.ms/PSWindows

PS C:\Windows\system32> terraform
Usage: terraform [global options] <subcommand> [args]

The available commands for execution are listed below.
The primary workflow commands are given first, followed by
less common or more advanced commands.

Main commands:
  init       Prepare your working directory for other commands
  validate   Check whether the configuration is valid
  plan       Show changes required by the current configuration
  apply      Create or update infrastructure
  destroy    Destroy previously-created infrastructure

All other commands:
  console    Try Terraform expressions at an interactive command prompt
  fmt        Reformat your configuration in the standard style
  force-unlock Release a stuck lock on the current workspace
  get        Install or upgrade remote Terraform modules
  graph      Generate a Graphviz graph of the steps in an operation
  import     Associate existing infrastructure with a Terraform resource
  login      Obtain and save credentials for a remote host
  logout     Remove locally-stored credentials for a remote host
  metadata   Metadata related commands
  output     Show output values from your root module
  providers  Show the providers required for this configuration
  refresh    Update the state to match remote systems
  show       Show the current state or a saved plan
  state      Advanced state management
  taint      Mark a resource instance as not fully functional
  test       Execute integration tests for Terraform modules
  untaint    Remove the 'tainted' state from a resource instance
  version    Show the current Terraform version
  workspace  Workspace management

Global options (use these before the subcommand, if any):
  -chdir=DIR  Switch to a different working directory before executing the
              given subcommand.
  -help       Show this help output, or the help for a specified subcommand.
  -version    An alias for the "version" subcommand.
PS C:\Windows\system32>
```

Step 9 : Perform terraform -v command to check terraform is installed or not.

```
PS C:\Windows\system32> terraform -v
Terraform v1.9.6
on windows_amd64
PS C:\Windows\system32>
```
